EECS16A Imaging 2

TA, ASE, ASE, ASE
Agenda

- Quick overview + review
- Images as matrices and vectors
- Pixel-by-pixel scanning
- Reconstructing scans as images
Last Week: Imaging 1

- Built our very first circuit!
  - What did this circuit do?

Circuit Diagram

Breadboard Diagram
Today’s Lab: Single Pixel Scanning

- Circuit from last week measures light intensity
- Projector illuminates index card in a controlled way
- Python programming to reconstruct image
Why?

- **Imaging 1:**
  - Finding a link between physical quantities and voltage is powerful
  - If you can digitize it, you can do anything (IOT devices, internet, code, processing)

- **Imaging 2:**
  - What measurements are good measurements?
    - Remember Kody and Nara from Dis1A?
Kody and Nara

2. Finding The Bright Cave

Nara, the one-handed druid, and Kody, the one-handed ranger, find themselves in dire straits. Before them is a cliff with four cave entrances arranged in a square: two upper caves and two lower caves. Each entrance emits a certain amount of light, and the two wish to find exactly the amount of light coming from each cave. Here's the catch: after contracting a particularly potent strain of ghoul fever, our intrepid heroes are only able to see the total intensity of light before them (so their eyes operate like a single-pixel camera). Kody and Nara are capable adventurers, but they don't know any linear algebra—and they need your help.

Kody proposes an imaging strategy where he uses his hand to completely block the light from two caves at a time. He is able to take measurements using the following four masks (black means the light is blocked from that cave):

\[
\begin{array}{c}
\text{Cave Labels} \\
\begin{array}{cc}
x_1 & x_2 \\
x_3 & x_4 \\
\end{array}
\end{array}
\]

![Image](image.png)

Figure 1: Four image masks.

(a) Let \( \mathbf{i} \) be the four-element vector that represents the magnitude of light emanating from the four cave entrances. Write a matrix \( \mathbf{K} \) that performs the masking process in Figure 1 on the vector \( \mathbf{i} \), such that \( \mathbf{Ki} \) is the result of the four measurements.

(b) Does Kody's set of masks give us a unique solution for all four caves' light intensities? Why or why not?

(c) Nara, in her infinite wisdom, places her one hand diagonally across the entrances, covering two of the cave entrances. However, her hand is not wide enough, letting in 50% of the light from the caves covered and 100% of the light from the caves not covered. The following diagram shows the percentage of light let through from each cave:
Illuminating the Big Picture

- **Linear dependance**
  - When can you recover your image?
  - Does it matter what mask matrix you pick?
  - Does it matter how you cover the pixels?

- **Invertibility**
  - When can you solve $Ax = b$?
  - How does this relate to our system?
  - How does this affect the way we pick our masking matrix?
Setup

Power strip to power your projector
Sample Images

Sample Images

Nick:
Images, Matrices, Vectors

- What are the unknowns in our system?
- Want to do an experiment to get information about these unknowns.
- We can do a lot of interesting processing on vectors, but we need to convert the image into one first
  - In lecture and discussion, you have seen how to turn an image into a vector. How?

\ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\end{bmatrix}
\]
How Scanning Works: iPython

The figure shows a matrix $H$ representing the scanning process. The matrix contains a sequence of ones and zeros, indicating the presence or absence of scanned content. The process involves scanning in a specific direction, as indicated by the arrow, and collecting the scanned data into a column vector.

The matrix $H$ is defined as follows:

$$
H = \begin{pmatrix}
1 & 0 & 0 & 0 & 0 & 0 & 0 & \cdots \\
0 & 1 & 0 & 0 & 0 & 0 & 0 & \cdots \\
0 & 0 & 1 & 0 & 0 & 0 & 0 & \cdots \\
0 & 0 & 0 & 1 & 0 & 0 & 0 & \cdots \\
0 & 0 & 0 & 0 & 1 & 0 & 0 & \cdots \\
0 & 0 & 0 & 0 & 0 & 1 & 0 & \cdots \\
\vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \ddots \\
\end{pmatrix}
$$

The column vector on the right represents the scanned data, collected into a single row.
How Scanning Works: iPython

\[ H = \begin{array}{cccccccc}

0, 0, 0, 0, 0, 0, 0, 0 \\
\end{array} \]
How Scanning Works: iPython
What Makes a Mask Good?

- Linearly independent columns $\rightarrow$ Invertible
  - Can’t get a solution without this
  - There is a unique solution

- What would be a bad mask?

- Food for thought: Are all invertible matrices equally as good?
  - Find out in Imaging 3 in two weeks...
  - No lab next week!
Tips for a Good Image

- READ CLOSELY. There are many small directions that help you get a good setup
- Focus projector using dial on the side
- Close the box firmly & scan under dark conditions
Important Notes

- You should have your kit from last week
- Equipment in cardboard box:
  - Put everything back before you leave!
    - Including Projector’s Power Cable
- Make sure you are using the correct COM port
  - Not COM1, and not the debugger
- No signal when testing the oscilloscope on the previous circuit?
  - Unplug P6.0 from MSP and debug if necessary
- Do not remove sharpies and tape from the desk
- If something isn’t working, worst case, close everything and turn it back on (works 9/10 times)
Debugging

1. Make sure wires/resistors/light sensor are not loose
2. Light sensor orientation: short leg goes into +
3. Check COM Port
4. Reupload code to launchpad after making any change in circuit
5. Check Baud Rate in Serial Monitor (115200)
6. Projector might randomly restart in the middle of the lab. Make sure brightness 0 contrast 100.
7. Cover box with jacket for dark scanning conditions
8. If you see a very bright corner in the scan, move the light sensor away from the projector
